Infrared Technology from Leister for the Textile Industry

Precise and Optimized Heating with KRELUS Infrared Heaters

The powerful KRELUS infrared heaters from Leister are ideally suited for customer-specific infrared solutions in the textile industry. Whenever high radiation intensity, easy controllability, short reaction times, and custom solutions with optimum economic efficiency are required, KRELUS infrared solutions are your solution of choice. They have proven themselves worldwide.

Heating Processes in the Textile Industry

There are many processes in the textile industry that require heat. These are primarily processes for further processing and finishing of textile materials. These include coating, drying, heat-setting and embossing. Leister offers fast-reacting, energy-efficient infrared heaters (IR heaters).

Dip coating, embossing, laminate

IR Heaters in Textile Finishing

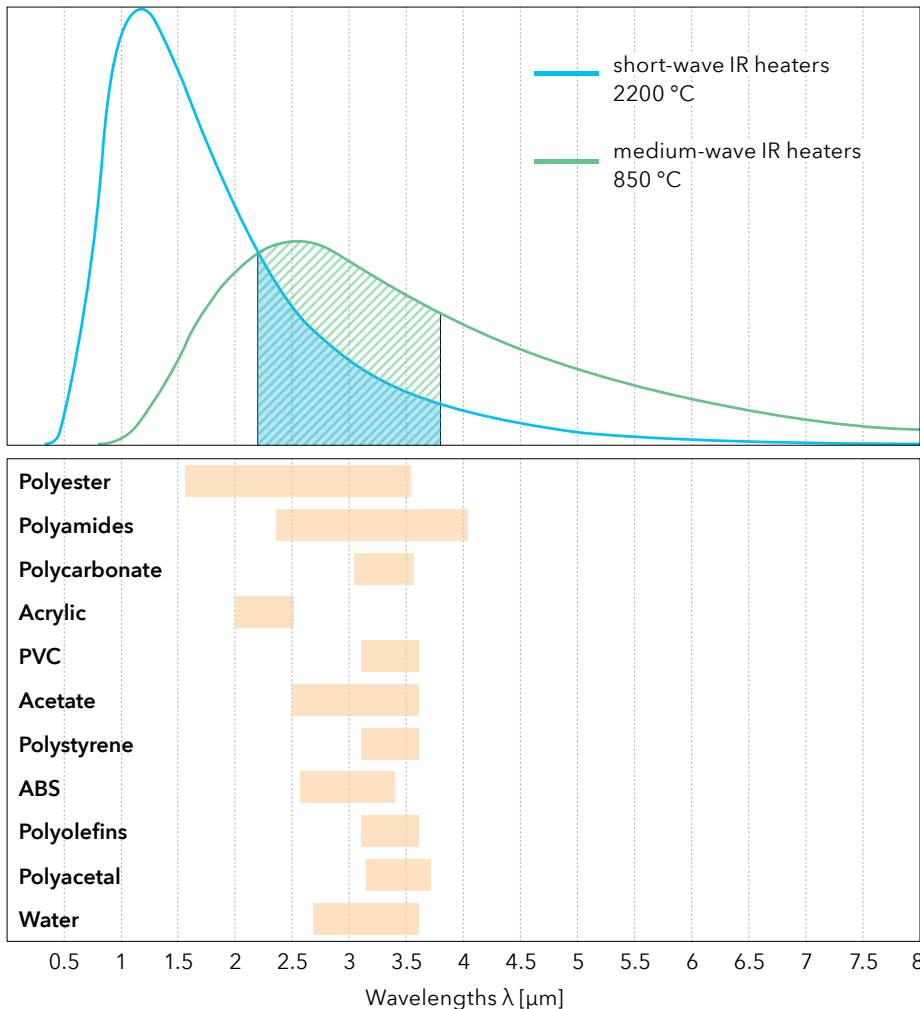

There are various IR heating processes in the textile industry. They mainly take place in the textile finishing production stage. To do so, short or medium-wave IR heaters are used. In terms of short-wave IR heaters, halogen or other glass tube heaters are common, while ceramic, quartz and metal film heaters are typical for medium-wave IR heaters.

It all Depends on the Wavelength

All textiles, whether synthetic or natural fibers, absorb medium-wave IR radiation very well. The absorption bands are concentrated for almost all thermoplastics, organic materials, paper and wood in a wavelength range from 1.6 to 4.1 μm . The absorption bands of water are also within this range at 2.8 to 3.7 μm .

For most applications in the textile industry, the medium-wave KRELUS IR heaters from Leister are a great fit.

The Advantages of the IR Heater

The various heater types for heating processes in the textile industry have differing characteristics. They emit short or medium-wave IR radiation and react quickly or slowly. The right wave length allows for good absorption, while the fast reaction time provides you with precise temperature control of your product and optimal operation.

Energy Efficient and Application Specific

For non-contact heating with IR heating in textile processing, unlike convection and contact, no additional medium is heated. The direct input of energy into the product increases energy efficiency. Fast-response IR heaters such as short-wave glass tube heaters and medium-wave metal foil heaters allow for on-demand operation. They are only switched on when they are needed. Only then they consume electricity, thereby ensuring energy-efficient operation. Slow-reacting heaters, such as ceramic heaters, are not capable of offering demand-controlled operation.

Versatile Areas of Application

The KRELUS IR heaters from Leister are suitable for various processes in textile finishing. They are especially well suited for the following applications:

- drying and pre-drying,
- activating adhesives (hotmelt or powder),
- gelling of polyvinyl chloride (PVC),
- sintering of polytetrafluoroethylene (PTFE),
- thermal fixing of fabrics and
- plasticization of surfaces prior to embossing.

The KRELUS IR Heaters from Leister

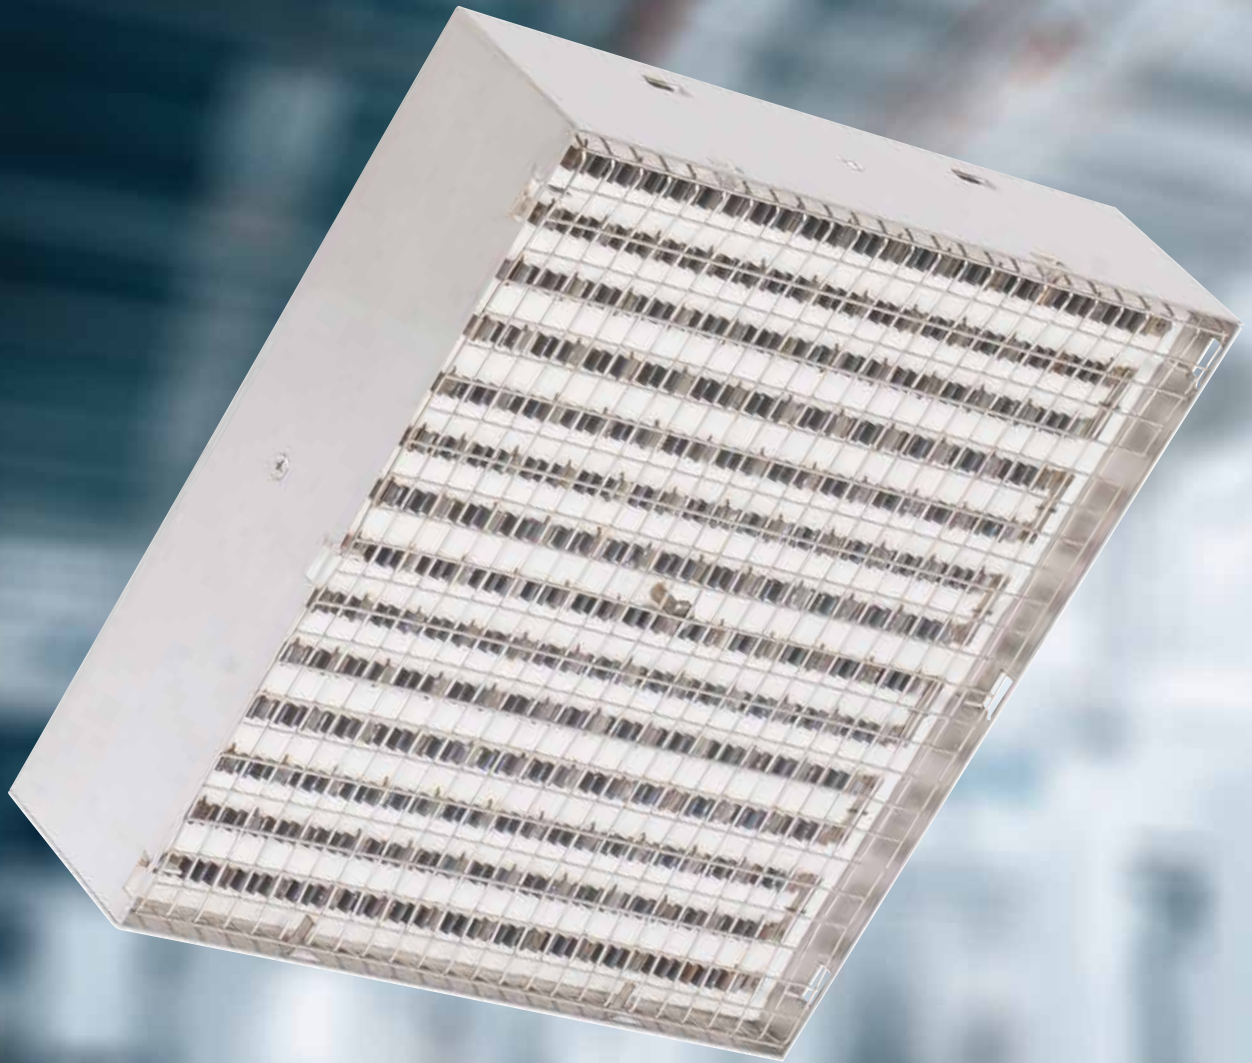

The KRELUS IR heaters from Leister belong to the class of heaters with the most advantages. The metal foil heaters are fast, efficient and easy to control. With their medium-wave IR radiation, they emit the best wavelength for textile finishing processes.

Take advantage of many benefits of the KRELUS IR heaters and optimize your heating process. They offer you:

- quick response times,
- demand-controlled and energy-efficient operation,
- precise control of the product temperature and
- a high degree of safety in case of production interruptions (emergency stop situations).

Drying with KRELUS IR Heaters

Drying processes are used in various finishing methods. For example, for drying fabric after wet treatment, during bleaching or after applying finishes. Here, the aim in the finishing is specifically low energy consumption, short processing times and precise temperature control. The KRELUS IR heater from Leister offers all of these advantages.

In many cases, KRELUS IR heaters are used after wet treatments for drying. The drying process is often followed by the crosslinking process, which can also be supported by IR heaters. Heat input via medium-wave IR heating in drying processes is very efficient for heating wet fabrics to

evaporation temperature. Both the water and the material absorb the medium-wave IR radiation very well in most cases. This type of direct heat input is more efficient than indirect heating via convection.

Absorption of Water

- Absorption spectrum of water
- Emission spectrum of short wave IR-heaters (2200 °C)
- Emission spectrum of medium wave IR-heaters (850 °C)

KRELUS G7-50 MINI

KRELUS G7-50 MINI rectangular infrared heaters can be combined into heater fields. They can also be used with KRELUS G14-25 MINI heaters in one heater field.

KRELUS G14-25 MINI-MINI

KRELUS G14-25 MINI-MINI rectangular heaters are half the size of the KRELUS-MINI heaters. That means it offers great flexibility when setting up heater fields.
